

CLEANVERSE BUILD · TRUSTED ASSETS HACKATHON

BridgeSure

Compliance-continuous escrow for cross-border trade

Programmable settlement that releases verified CVA funds by milestone—and fails safely when a counterparty's identity or asset eligibility changes.

Business plan & product deck · August 2026

The trust gap in cross-border settlement

Importers and exporters routinely rely on slow bank instruments, fragmented escrow providers, and manual compliance checks. These systems may verify a party at onboarding but struggle to react when credentials expire, sanctions status changes, or settlement assets prove ineligible while goods are in transit.

BridgeSure makes compliance a condition of every release—not a checkbox completed once.

\$20T

Approximate annual global maritime trade value.

30–90 days

Typical working-capital pressure from trade payment terms.

Fail closed

Revoked or expired identity blocks the next value-moving action.

Audit-ready

Every decision ties to policy evidence and transaction hashes.

A programmable trade escrow

BridgeSure creates a trade-specific escrow between a verified exporter and importer. The buyer funds the escrow with a Cleanverse Verified Asset (CVA). Payment is released in configurable portions when milestones are submitted and current compliance checks pass.

Initial use case

A €10,000 shipment with 30% released on dispatch documentation, 40% on in-transit confirmation, and 30% on delivery. A revoked importer credential before the final release automatically blocks settlement.

Users

SME exporters and importers, freight platforms, licensed payment institutions, trade-finance desks, and compliance teams.

Cleanverse is load-bearing infrastructure

CVI · Verified Identity

Wallet-bound, bank-verified credentials identify the exporter, importer, and optional logistics attestor. Status is queried at creation and before every release, refund, or withdrawal.

CVA · Verified Assets

Escrows accept only verified, traceable assets. Provenance and transfer restrictions travel with the settlement asset instead of living in a separate database.

CCP · Policy gates

Pre-transaction checks evaluate identity, asset, jurisdiction, amount, and milestone before any value moves.

Travel Rule & reporting

Each settlement leg carries attribution data and produces an audit packet with reason codes and on-chain evidence.

Technical architecture

BridgeSureEscrow manages the state machine; **TradeRegistry** anchors trade and document hashes; **ComplianceAdapter** isolates Cleanverse sandbox/API calls; **AuditEmitter** produces indexable lifecycle events; a web console presents live decisions.

Focused wedge, expandable platform

Existing trade settlement is expensive and operationally fragmented. Crypto escrow improves programmability but often lacks verified counterparties, compliant assets, and a safe response to mid-trade status changes.

Why now

Stablecoins and tokenized assets make programmable settlement practical; institutions still need identity, asset provenance, and evidence before deploying capital.

Our wedge

Start with one corridor, one CVA stablecoin, and milestone escrow. Prove a high-value control: a release that safely stops after revocation.

Competitive edge

Competitors cover lending, issuance, agents, AMMs, and invoice finance. BridgeSure specializes in compliance continuity inside real trade settlement.

Expansion

Procurement escrow, construction retainage, merchant settlement, receivables finance, and multi-chain settlement.

Beachhead customers

Cross-border SMEs working with fintech payment providers; freight and logistics marketplaces; licensed trade-finance desks; and institutions that need controlled stablecoin settlement without building their own compliance stack.

Infrastructure revenue with a clear pilot path

Transaction fee

A small fee on funded and released escrow volume, shared with distribution or payment partners where appropriate.

Enterprise subscription

Monthly access to workflow configuration, roles, limits, policy templates, and compliance-console features.

Integration services

Implementation and API integration for fintechs, logistics platforms, and regulated institutions.

Reporting tier

Premium audit exports, retention, analytics, and institution-specific evidence packages.

Go-to-market

1. Build a sandbox pilot with one trade-finance or payment partner.
2. Run a single corridor with a narrow asset and milestone template.
3. Measure release time, blocked-risk events, reconciliation effort, and cost per transaction.
4. Expand through logistics and payment-platform integrations.

Trust and risk posture

BridgeSure is designed as non-custodial programmable escrow with explicit hold/refund states. The MVP will use sandbox credentials and testnet funds; production pilots require legal, custody, and jurisdiction-specific review with licensed partners.

What we will ship

Day 1

Cleanverse onboarding, escrow contracts, CVI/CVA adapter, funding and milestone logic.

Day 2

Compliance console, audit export, deployment, tests, and recorded demo.

Acceptance criteria

- Verified parties can create and fund an escrow.
- Non-CVA assets are rejected.
- Compliant milestone release succeeds.
- Revoked or expired CVI blocks a subsequent release.
- Hold/refund path is deterministic and visible.
- Every action has an event, reason code, and transaction hash.
- Public repository and hosted deployment are reproducible from the README.

Demo narrative

Show the happy path first, then change one identity state in the sandbox and repeat the exact same release. The contrast—payment succeeds while compliant, then fails closed after revocation—makes the value immediately legible.

From hackathon proof to institutional rail

Near-term success metrics

Settlement speed

Reduce manual release time from days to minutes.

Control coverage

100% of value-moving actions pass an explicit policy gate.

Evidence quality

One-click audit packet for every trade lifecycle.

Pilotability

One corridor, one asset, one licensed partner.

BridgeSure turns “trust us until settlement” into “prove eligibility at settlement.”
